1. DATA AND DOCUMENTATION

Code	Description	Colour	Dimensions (mm)	Weight	Pkg. / Pallet
VET01-5033	Brick Glass Cup Small	-	145 x 145 x 55	1.35 kg/pc.	10 pcs. / 840 pcs.
VET01-5034	Brick Glass Large Cup	-	190 x 190 x 70	2.40 kg/pc.	6 pcs. / 312 pcs.

MATERIAL

Made of a single block of glass.

2. USE

Traditionally used in the construction of prefabricated glass-concrete plates and/or load-bearing floor slabs (for axial loads) and/or horizontal structures (including flat roofs) where it is necessary to provide lighting to rooms and/or spaces below.

CUP GLAZING

Horizontal structures are understood to be works with linear or curved development, for interior and exterior use. They may be either in-situ or prefabricated, in each case the following parameters must be considered:

- dimensions of the surface to be realised.
- own weight of the glazed structure to be assembled.
- positioning of the structure to be realised.
- number of glass blocks and repeatability.
- complexity and type of geometric shape to be covered.

PRELIMINARY PHASE

With the wide range offered, Dakota allows you to realise various walkable architectural solutions with the transparency of glass, while maintaining safety and stability.

DIMENSIONING AND LOADING

Dakota glass blocks and all accessories are to be used for horizontal structures that can be defined as simply supported panels.

It is therefore to be avoided, for proper design, that structures made of Dakota glass blocks form part of load-bearing elements or that they are embedded. This caution should be used since glass blocks are NOT structural elements, being purely lightening.

The loads supporting the elements are considered to be predominantly static, this characteristic allows the floor made of glass blocks to be walkable. The larger the size of the bricks, the lower the load-bearing capacity of the structure, since the escape routes (at least 3 cm) are the load-bearing part of the structure itself. For proper glass cleaning in the case of skylights made of glass bricks, an adequate slope must be considered.

Format (mm)	Horizonta	l Glazing	Approximate weight of structure kg/m2	Number of pieces per ^{m2}	
	Model	Unit weight (kg)	3 cm leaks	3 cm leaks	
190 x 190 x 80	VET01-5030	2,90	≈ 105	≈21	
200 x 200 x 22	VET03-5020	2,30	≈ 100	≈ 19	
145 x 145 x 55	VET01-5033	1,40	≈ 90	≈ 33	
190 x 190 x 70	VET01-5034	2,60	≈ 95	≈21	

The above data refer to structures with cement mortar weighing 1800 kg/m3 and with a reinforcement for each escape route equal to two Ø 8 bars (0.39 kg/m). In the case of VET01-5033, only a Ø 8 bar was considered. For escape routes larger than 3 cm, special calculations must be carried out.

Overload		Structures NOT walkable 200 kg/m2			Walkable structures 400 kg/m2			
iron diameter (mm)		ø 6	ø 8	ø 10	ø6	ø 8	ø 10	
Model								
VET01-5030	m2	4,5	8,0	9,5	2,7	4,8	6,0	
VET01-5034	m2	4,0	6,5	8	2,3	4	4,5	
VET01-5033	m2	3,5	4,5	5,5	2,0	2,5	3,0	

The data above are the maximum dimensions of horizontal panels with 3 cm joints depending on the overload, the dimensions of the reinforcement rods and the product.

The data were calculated considering these assumptions:

panels with recessed joists resting on all four sides.

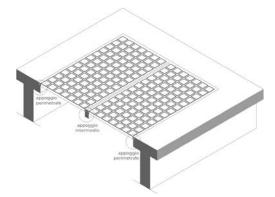

uniformly distributed overload.

permissible stresses:

•	iron	1000 kg/cm2
•	concrete	50 kg/cm2

joint 3 cm.

PERIMETER ANCHORAGE POINTS

Horizontal Dakota glass elements must always be kept at a minimum distance of **3 cm from** the supports in order to avoid disregarded loads.

This avoids direct contact with the support of the glazing row.

The joint should preferably be all round with a slip joint.

Both joint and panel must be modified accordingly.

In the event that the glass bricks are flush with the roof or floor, an **elastic** expansion **joint** sealed with **cold-stretched** materials must be prespecified at the top of the panel.

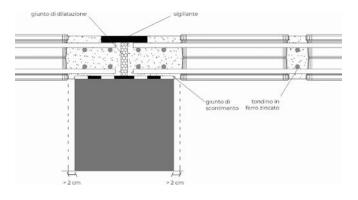

INDOOR

This data sheet replaces and cancels the previous ones. The information contained herein corresponds to our current knowledge. No liability and no recourse can be derived from them. CUP GLAZING

INTERMEDIATE SUPPORT POINTS

Also in this case, the horizontal Dakota glass elements must always be kept at a minimum distance of **3 cm from** the supports, in order to avoid unaccounted-for loads.

This avoids direct contact with the support of the glazing row.

Obviously, the **interruption on the support of t** he **reinforcement bars** must also be considered in order to avoid internal stresses in the structure.

3. SPECIFICATION ITEM

Entry	Description	Unit	Price
Dak.I.VET01.503x	Supply and installation of 'cup' glass block available in the dimensions 145 x 145 x 55 and 190 x 190 x 70 mm. It does not require a tile. Made from a single block of glass. Traditionally used in the construction of prefabricated glass-concrete plates and/or load-bearing floors (for axial loads) and/or horizontal structures (including flat roofs) where it is necessary to provide lighting to rooms and/or spaces below.		
Dak.I.VET01.5033	Dimensions 145 x 145 x 55 mm	pc.	-
Dak.I.VET01.5034	Dimensions 190 x 190 x 70 mm	pc.	-
